

Fernando Uribe Trujillo

Full Stack Developer — Electronic Invoicing & Logistics Systems

Manzanillo, Colima, Mexico · uribetrujillof7@gmail.com · github.com/FernandoUribeT · linkedin.com/in/fernandouribetrujillo · Available for remote work

PROFILE

Software engineer with production experience on a multi-tenant SaaS platform for transportation management, handling real tax data. Specialized in Mexican electronic invoicing (CFDI 4.0, Carta Porte, payment complements) and in building complete logistics operation modules end to end, from database schema to user interface.

EXPERIENCE

Full Stack Developer — Velor Innovation

Multi-tenant transportation management SaaS — Manzanillo, Mexico

February 2026 – July 2026 · 169 contributions to the repository

- **Trip scheduling and calendar module.** Complete module built from scratch: drag-and-drop scheduling with business-rule validation, dynamic event loading over an API, filters by client, unit and driver, and per-event-type colors persisted to the database.
- **Supplier portal.** Lead developer of the portal (sole author of 45 of its 71 components). Built the digital records subsystem: document upload, OCR extraction, automatic classification and cross-validation against government-issued tax certificates, national ID and proof of address, with expiry control. Includes digital signature via the Mexican government e.firma, master contract generation, and autofill of fiscal data from the taxpayer's official status certificate: I added *smalot/pdfparser* to read the PDF text layer, with OCR as fallback and a clear message when the file is scanned and carries no extractable text.
- **Vehicle inspection module.** Complete module, sole author: configurable checklists with digital signatures, photos and signatures embedded in generated PDFs, and automatic locking of units when critical faults are detected. Separated business rules from data access into policy and repository layers.
- **Electronic invoicing.** XML importer for CFDI 4.0 invoices, validation rules for the Carta Porte freight complement and payment complements, double-stamping prevention, and centralized idCCP generation following the RFC 4122 v4 standard.
- **Performance and database work.** Diagnosed and removed an N+1 query problem in the warehouse dispatch history, consolidating the load into a single LEFT JOIN query: from N queries per request down to one. Also profiled and removed the calendar's load bottlenecks.
- **Tire and maintenance management.** Migrated referential integrity to a tire-identifier based schema, built position traceability with log history, a global fault panel, and automation of supply purchase orders.
- **QR identifier system** for trucks and trailers, with real MIME-type detection for logos and controlled output resolution.
- **Bulk data migrations** of client and supplier catalogs with tax regime verification, plus Excel import with catalog validation for drivers, trucks and trailers.
- Worked on a legacy codebase of 5,000+ files with no automated test suite, shipping changes to production without regressions.

PROJECTS

fleet-maintenance

Laravel 13, PHP 8.5, PHPUnit — public code on GitHub

- Multi-tenant service that tells a dispatcher which units can go out today and which are held back for service, deciding on whichever limit is reached first: kilometres driven or days elapsed. Per-company isolation through a global query scope that fails closed, and a detail route answering 404 rather than 403 for another tenant's record.
- Business rules live in plain PHP classes with no framework dependency, so the 12 domain tests run in 2 ms without booting Laravel or touching a database; the 24 integration tests take 1.6 s. Built test-first: 36 tests, 69 assertions.

dof-scraper · dof-watch

Python, pytest, n8n — public code on GitHub

- Scraper for the documents published daily by Mexico's official government gazette, with automated tests and sanity checks: it refuses to emit results it cannot verify. Documented three reproducible defects in the source site.
- Automation that runs it every morning and separates a transport failure from a data failure, because the two demand different responses and different urgency.

Other projects with public repositories

- **simulador-ensamblaje-unity** (2025). Augmented-reality training simulator (Unity + Vuforia) used to assess students on disassembling and reassembling a 3D model in sequence. Phase-based state machine and component-driven architecture.
- **appsalon-mvc-php** (2025). Course project on plain-PHP MVC; the router and ActiveRecord layer come from the course material, the booking domain is mine. MySQL.
- **ReUC** (2025). Platform for tracking issues in the productive sector. JavaScript. · **Seguros-App** (2024). Kotlin insurance app on Firebase: auth, realtime database, push.
- **Heart-rate monitoring wearable** for patients with senile dementia. Sensor reading and biometric processing in C/C++.

TECHNICAL SKILLS

Languages: PHP, JavaScript, SQL, Python, Kotlin, C/C++

Frameworks & testing: Laravel (Eloquent, Blade), PHPUnit, test-driven development, Composer

Data: MySQL, Firebase, XML processing, OCR applied to documents

Domain: Mexican electronic invoicing (CFDI 4.0), Carta Porte freight compliance, payment complements, digital signature

Tools: Git, REST API integration, n8n, PDF generation, Linux

EDUCATION & CERTIFICATIONS

B.Eng. in Software Engineering — Universidad de Colima

Faculty of Electromechanical Engineering, El Naranjo Campus, Manzanillo · GPA 3.78/4.0

Coursework completed · Degree title in process

- Machine Learning and Data Science with Python — Udemy, 2025 (31 h)
- Object-Oriented Programming with PHP — Udemy, 2023 (18 h)

LANGUAGES

Spanish — Native English — B1
